DESCRIBE THE PRESENT AND ORIGINAL (If known) PHYSICAL APPEARANCE

At the height of operation (1863-1872), the Maramec Iron Works was a densely populated area of 300 people, most of whom were employed at the Iron Works. During this period there were forty-two industrial, commercial and residential buildings within this iron works complex.

At present, the historic structures remaining within the district are the stack of the cold-blast furnace, five refinery forge stacks, and the following three dwellings: the Maramec House, McDole Cabin, and the Jolley Cabin.

The cold-blast charcoal furnace was built in 1857 to replace a smaller one built in 1828. The furnace stack faces north-east. Stack is constructed of cut sandstone blocks, stands 35 feet high and has a fire brick inwall. Furnace stack is topped by a brick gas chimney, 25 feet 8 inches high, extending ~~the complete structure to a height of 60 feet 8 inches.~~ Furnace was originally enclosed on the front (northeast) by a wooden frame casting-house and on the rear (southwest) by a bridge house, both of which no longer stand. The bridge house enclosed a timber trestle bridge which connected the furnace with its raw material stock pile.

the height of the complete structure to

The five refinery forges, located southeast of the blast furnace, converted the pig iron from the furnace into wrought iron bars or "blooms". Each refinery forge stood about 22 feet high, was constructed of cut sandstone blocks, and had a brick gas chimney. Originally the forge stacks were enclosed by a frame structure.

Maramec Spring, located south of this industrial complex, was the source of power for the iron works. This spring has an average daily discharge of 96,300,000 gallons and continues to flow over the original rock-fill dam. This dam was built to divert the spring water into two main mill races, which carried water to the furnace, forges and grist mill.

The Maramec iron ore pit is located $\frac{1}{4}$ mile west of the furnace. Ore is hematite with very little phosphorous. Ore pit is ovoid in shape having a major northwest-southeast axis of 350 feet and a minor northeast-southwest axis of 250 feet. Pit is 75 feet deep. Most unusual feature of the mine is the central cone or "horse" of rock, which is 75 to 100 feet in diameter at base. A hollow runs from the ore pit to the furnace area.

There is a hollow between the ore pit and the furnace area.

STATEMENT OF SIGNIFICANCE (Include Personages, Dates, Events, Etc.)

Maramec Iron Works District is Missouri's most complete surviving example of an early, large-scale iron industry. Iron was produced at this works from 1826-1876. During this time, there were other large iron producing districts in Missouri; but this works was the largest and most productive.

The surviving structures within this district are unique in both quantity and quality as a result of the continued efforts of the owner to preserve the district and its artifactual contents. The district is owned and maintained by the James Foundation, which has restored the existing iron-producing structures. No attempt has been made to restore the entire industrial complex.

Thomas James and Samuel Massey, who had both worked in the iron industry in Ohio, established the Maramec Iron Works in 1826. The major iron-producing portion of the industrial complex was completed by 1829. In the early years of operation, Samuel Massey supervised the Iron Works in Missouri, while James remained in Ohio. In 1843 Thomas James sent his son, William, to the works; and by 1847 William had purchased Massey's share of the business. The Works prospered during the Civil War and in 1874 James erected the Ozark Furnace, a hot-blast furnace located about 50 miles west of Maramec.

In the early 1870's, the decline in iron prices and the discovery of rich iron deposits in the Lake Superior region, initiated the decline of Maramec as the leading iron producer in Missouri. In 1876 the Maramec furnace was shut down and in 1877, the Ozark Furnace was also closed.

The Maramec Iron Works District was the major center of employment, commerce, and settlement in Southeast Missouri in the early-to-mid-19th century. The district attracted skilled workers and their families to a once sparsely settled area.

MARAMEC IRON WORKS DISTRICT

7. The Maramec House was built in 1848 by William James. "L" added after a fire in 1856. Interior construction is of hand-hewn oak 3" by 6" timbers used as rafters, sills and plates. Most wall studs are 2½" by 5" oak timber (sawed or hand-hewn). Floors are 1" by 8" or 1" by 6" pine with ½" notching on underside where joined to floor joists. Interior walls are surfaced with plaster and wood lath. Some plaster board additions are in evidence. Interior has three fireplaces. One has 60" wide by 60" high fire box with iron arch support, made at Maramec Iron Works. Two other fireplaces have 36" wide by 36" high fire boxes, back-to-back, with both flues in one chimney. Exterior of house is covered with 8" beveled siding. All doors are raised panel, 1 1/8" thick. Windows have six over six light sash. House rests on rock foundation, has been modernized with plumbing, heating and electricity. It is currently occupied.

The McDole Cabin was built in 1848 by Joseph E. McDole, apprentice blacksmith at the Iron Works. It is a one-story frame house with central rock chimney, back-to-back fire-boxes, one in each of the two original rooms. House has clapboard siding, ridge roof, and a two-room addition on the rear. House has been modernized with plumbing, heating, and electricity and is currently occupied.

The Jolley Cabin was built in 1848 by William B. Jolley, bookkeeper at the Iron Works. It is a one-story frame house with a central rock chimney, back-to-back fireboxes, one in each of the two original rooms. Has clapboard siding, lean-to addition at the rear (south) and rests on a rock foundation. Has been modernized with plumbing, heating, and electricity. It is currently occupied.

MARAMEC IRON WORKS DISTRICT

8. As the industrial complex expanded, a market center for the produce of the local farmers developed. Farm products and cut timber were exchanged for general supplies and various cast-iron products, such as plows, dutch ovens and skillets.

The Iron Works was also significant in the development of Missouri roads. Most early roads in Southeast Missouri and the surrounding area were oriented to and from the Iron Works. Products of iron were hauled over these roads to distant markets and outlet stores located at strategic geographical points. Also, the iron roads connected the Iron Works to points on the Missouri and Mississippi Rivers. From these points, iron ore and iron products were shipped to St. Louis and points farther east.

As an industrial complex, Maramec Iron Works District is the best example of Missouri's early iron manufacturing efforts.
